Deregulation of signalling networks

Context

- **e** Genomic alteration in cancers manifest themselves by altering the wiring and functionality of signalling networks.
- There are lots of resources that provide network that describe interactions between proteins.
- Networks are useful to explore signalling pathways but in general not cell-type specific and not computable models. May also have missing links.

[Biological context](#page-3-0)

Understand signalling networks

Why

- Most therapeutic affect elements of these networks.
- Understanding the deregulation of signalling networks in cancer is a useful approach to understand drug mode of action and identify novel therapeutic opportunities.

 $Q \cap R$

[Biological context](#page-3-0) [Data](#page-5-0)

Data perturbation

How can we link large protein networks to signaling data (i.e., biochemical measurements upon perturbation) to create cell-specific explanatory and predictive models ?

 $Q \cap R$

[Biological context](#page-3-0) [Data](#page-5-0)

Data origin and complexity

EMBL-I

To model signaling, proteomics is the natural source of data, but there are many platforms

Terfve, C., Saez-Rodriguez, J. 2012, Modeling Signaling Networks Using High-throughput Phospho-proteomics. Advances in experimental medicine and biology.

CellNOpt

Goals

- **•** Build a logic modelling to link protein signalling network with functional analysis of signal transduction. (i.e., training models to experimental data)
- **I** Identify active/inative links and logic gates (AND/OR)
- **•** Provide different mathematical logic formalisms to cover wide spectrum of modeling approaches (boolean, fuzzy, ode, ...)

Typical pipeline

Pipeline flow

- **a** Data is in MIDAS format. We have lots of non-official codecs for Luminex, Mass-Spec, RPPA formats.
- **.** Inputs Prior Knowledge Networks are in SIF/SBMLqual. Output of the optimisation can be in SIF/SBMLqual.
- **Optimisation can use various** formalisms (boolean, ode... see followinf slides)
- Visualisation of the PKN/MIDAS, Fitness versus experiments.

preprocessing

- Prior Knowledge Network must be transformed into a computable model.
- Logical gates (AND) should be added assuming existing edges are ORs.
- Nodes/Species that are not measured could be compressed to simplify the model.
- A modelling approach should be chosen to accomodate the complexity of the data. See next slides
- An optimisation approach (e.g. Boolean) should be chosen depending on the modelling approach
- Finally, interpretation and feedback are required to improve the original Network

Boolean formalism (steady state)

CellNOptR, boolean case, fitness

The Boolean formalism implements a steady state simulator given a logic model with AND/OR logical gates. The metric to evaluate a model given the data is

$$
\theta = \theta_f + \alpha.\theta_s
$$

where

$$
\theta_f = \sum_{i=1}^{S} \sum_{j=1}^{E} \left(X_{i,j} - \hat{X}_{i,j} \right)^2
$$

is the fit of the data, θ_s the model size N and α the relative importance of the fit versus size, $\mathsf{X}_{i,j}$ the measurements and $\hat{\mathsf{X}}_{i,j}$ the simulated values. Model parameters are the active/inactive edges. Optimisation is performed via Genetic Algorithm.

Saez-Rodriguez, J. et al., 2009. Discrete logic modelling as a means to link protein signalling networks with functional analysis of mammalian signal transduction. Mol Syst Biol.

[Main pipeline](#page-9-0) [preprocessing](#page-10-0) [Boolean approach](#page-12-0) [Fuzzy approach](#page-15-0) [Discrete-time approach](#page-17-0) [ODE approach](#page-18-0)

A toy model

Boolean formalism 1 and 2 steady state

EMBL-EL.

In CellNOpt, the Boolean steady state approach can identify :

- strong active links (or strongly inactive); see e.g., LHS figure
- strong feedback effects when using the 2 steady states formalism (RHS figure)

Terfve, C, Cokelaer T, MacNamara A, Henriques D, Gonçalves E, Morris MK, van Iersel M, Lauffenburger DA, Saez-Rodriguez J, BMC Syst Biol, 6:133, 2012

 Ω

[Main pipeline](#page-9-0) [preprocessing](#page-10-0) [Boolean approach](#page-12-0) [Fuzzy approach](#page-15-0) [Discrete-time approach](#page-17-0) [ODE approach](#page-18-0) **[Others](#page-21-0)**

Discrete Fuzzy formalism

Boolean modeling can not describe quantitative aspects, unlike the Fuzzy approach that can identify :

- **•** strong and weak active links
- **•** feedback loops cannot be identified.

- 2 parameters per edge to express the transfer function.
- discrete variables to speed up optimisation.

Discrete Fuzzy formalism

Morris MK, Saez-Rodriguez J, Clarke D, Sorger PK, Lauffenburger DA. PLoS Comp Bio 2011

[Main pipeline](#page-9-0) [preprocessing](#page-10-0) [Boolean approach](#page-12-0) [Fuzzy approach](#page-15-0) [Discrete-time approach](#page-17-0) [ODE approach](#page-18-0) **[Others](#page-21-0)**

Extends boolean to continuous time

Why not using Boolean at each time points ? This is the discrete-time formalism.

- **•** feedback loops can be identified.
- issue: more parameters so optimisation is more difficult

Main difference with steady state boolean approach is that updates are synchronous.

MacNamara A, Terfve C, Henriques D, Penalver B, Saez-Rodriguez J. Phys Biol 9 045003, [201](#page-16-0)2EMBL-I

[Main pipeline](#page-9-0) [preprocessing](#page-10-0) [Boolean approach](#page-12-0) [Fuzzy approach](#page-15-0) [Discrete-time approach](#page-17-0) [ODE approach](#page-18-0) **[Others](#page-21-0)**

logic-based ODE approach

Convert Boolean update function into a continuous homologue.

- strong and weak active links and feedback loops can be identified.
- issue: more parameters so optimisation is more difficult
- Convert the Boolean update function Bi into a continuous homologue Bi using multivariate polynomial interpolation
	- Accuracy (same behavior as Bi for $0/1 \rightarrow$ same monotony & steady state behavior)
	- · Good analytical properties (smoothness)
	- . Minimal and unique

. Make non-linear replacing variable with Hill function

 $f(\overline{x_i}) = \frac{\overline{x_i}^n}{(\overline{x_i}^n + k^n)}$

[Availability and development](#page-23-0)

Availability

CellNOptR is a suite of R packages

Official releases every 6 months on BioConductor.

- \bullet CellNOptR : main IO functionalities $+$ boolean formalism
- CNORode: the ODE optimisation/simulator
- CNORfuzzy: the discrete-fuzzy optimisation/simulator
- CNORdt: the discrete-time optimisation/simulator
- CNORfeeder: finds missing links

30,000 LOC (R code + manual), 5,000 LOC in C, + R tutorials.

GUI

CytoCopter

a Cytoscape plugin http://apps.cytoscape.org/apps/cytocopter Author: Emanuel Gonçalves see also: http://www.cellnopt.org/cytocopter/index.html

Visibility

Website

- Hosted at http:// www.cellnopt.org
- Provide access to sets of PKN/MIDAS files published or that serve as toy examples.
- links to official releases (BioConductor) and intermediate releases
- **•** mailing lists

Python packages

- the PKN/MIDAS files are also available independently as a Python package called cellnopt.data available on Pypi website.
- Access to the R packages in Python is possible via wrappers called cellnopt.wrapper.

Conclusions

CellNOpt Status

- One main R package called CellNOptR
- Provides common functionalities (e.g., IO such as MIDAS, SIF, SBMLqual)
- Various formalisms are available in CellNOptR or add-on packages (boolean, discrete time, ODE, boolean, fuzzy)
- Mailing lists, download pages, tutorials (www.cellnopt.org)

Future directions

- More tools for Parameter Estimation and Model fitting.
- Input Pathways (infered or web resources)
- Automatic name convertion to standard protein databases (e.g. UniProt)

メロメ メ母メ メミメ メミメ

目
