PHONEMeS ILP Implementation

ILP is a mathematical optimisation problem in which the objective function and constraints are linear while the variables are integers

General ILP statement:

$$\min_x (c^T x) \quad s.t.: Ax \leq b, \quad x \in \mathbb{Z}^n$$

Problems with binary decision variables occur often in many signalling model formulations

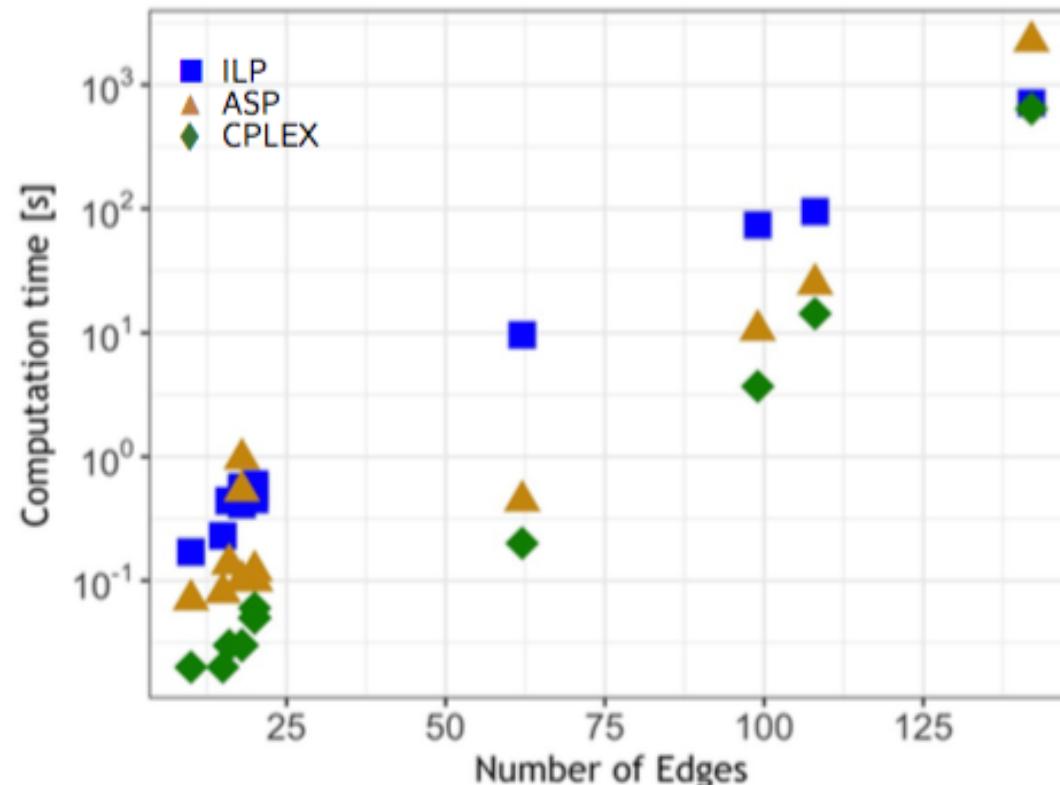

ILP implementations for **CellNOpt** and **PHONEMeS**

CPLEX solver

IBM
CPLEX

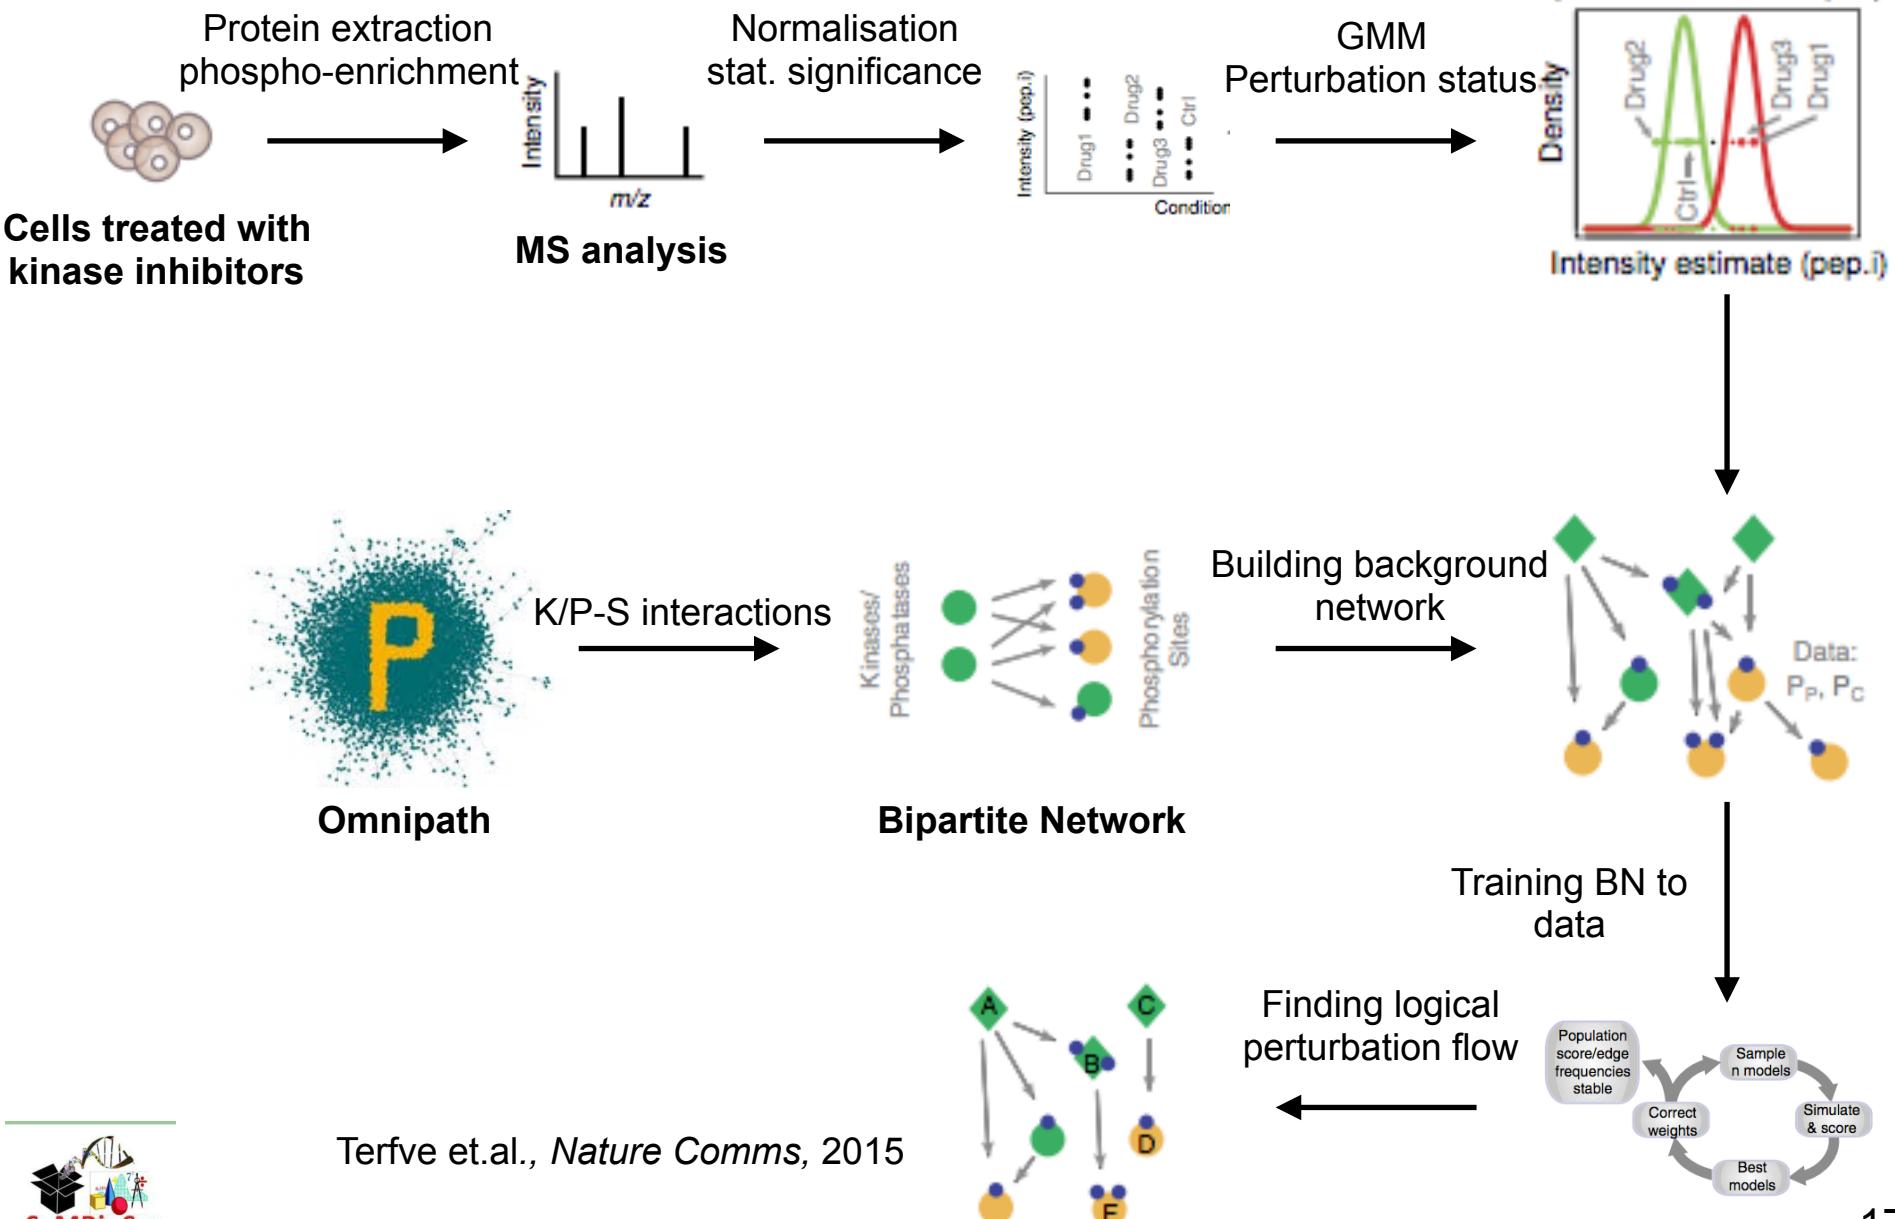

ILP implementation for CellNOpt (*Mitsos et.al.*)

Comparisons between different algorithms applied

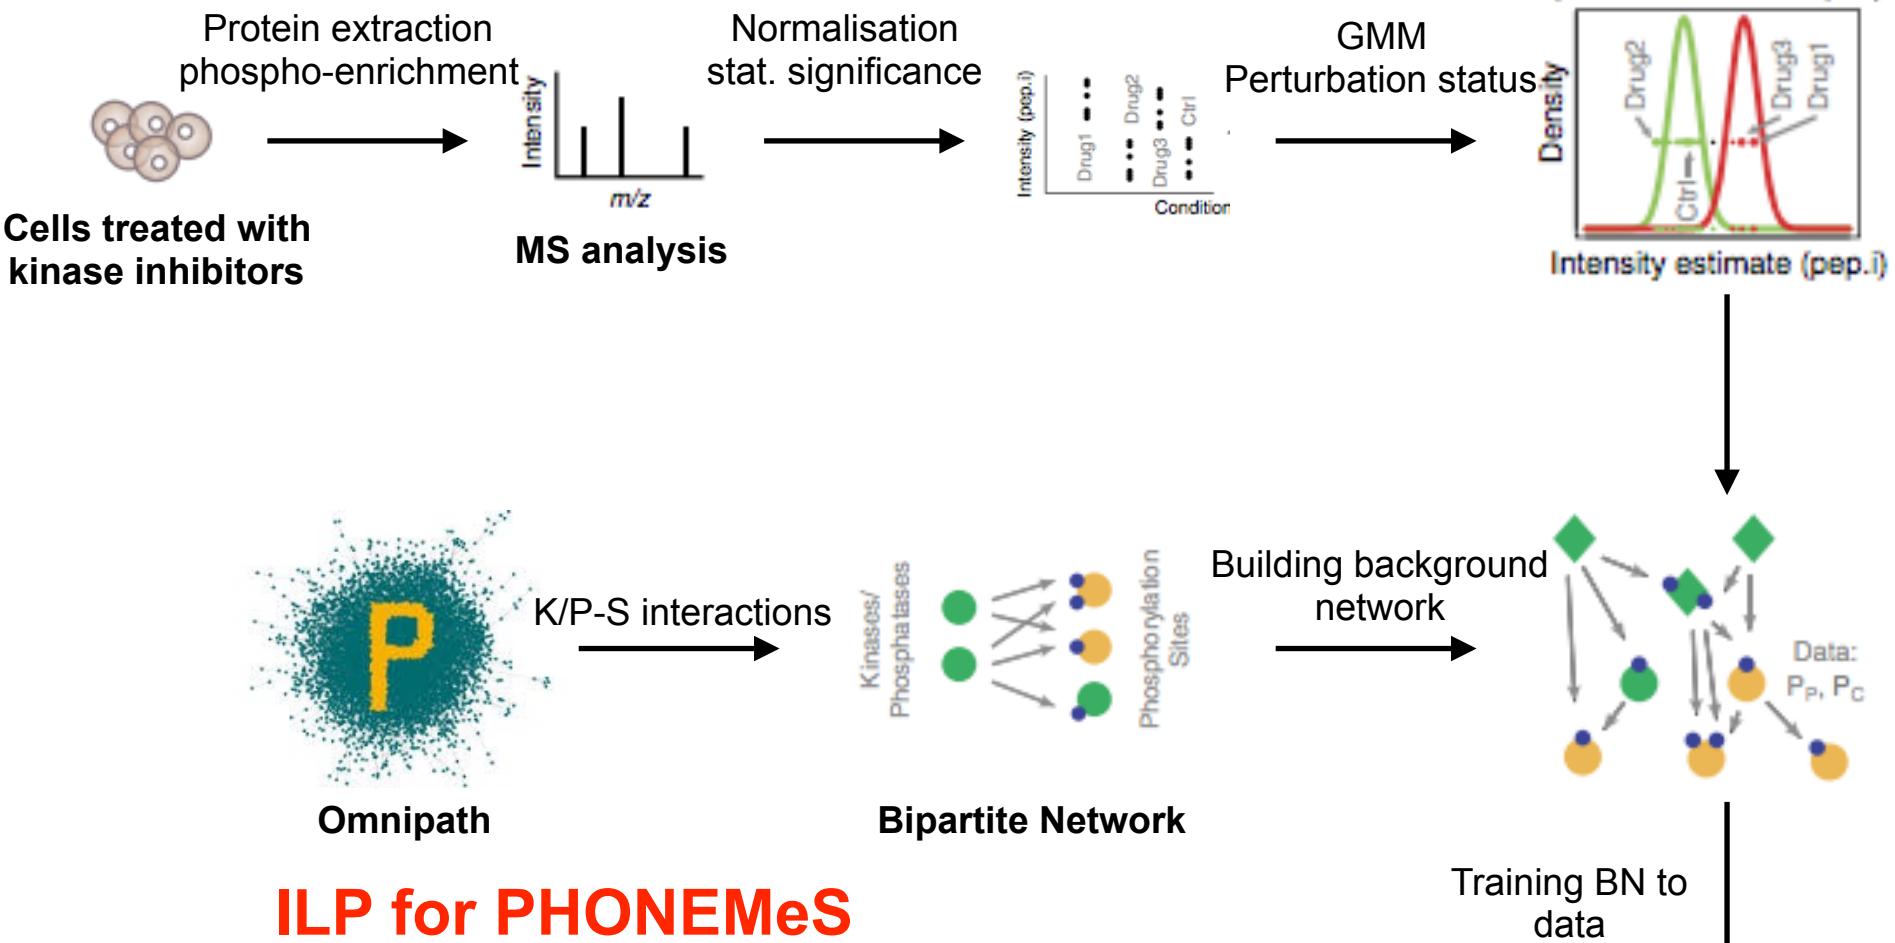

Accelerating model building from mass spectrometry data with ILP

Accelerating model building from mass spectrometry data with ILP

ILP for PHONEMeS

Can we make it faster??

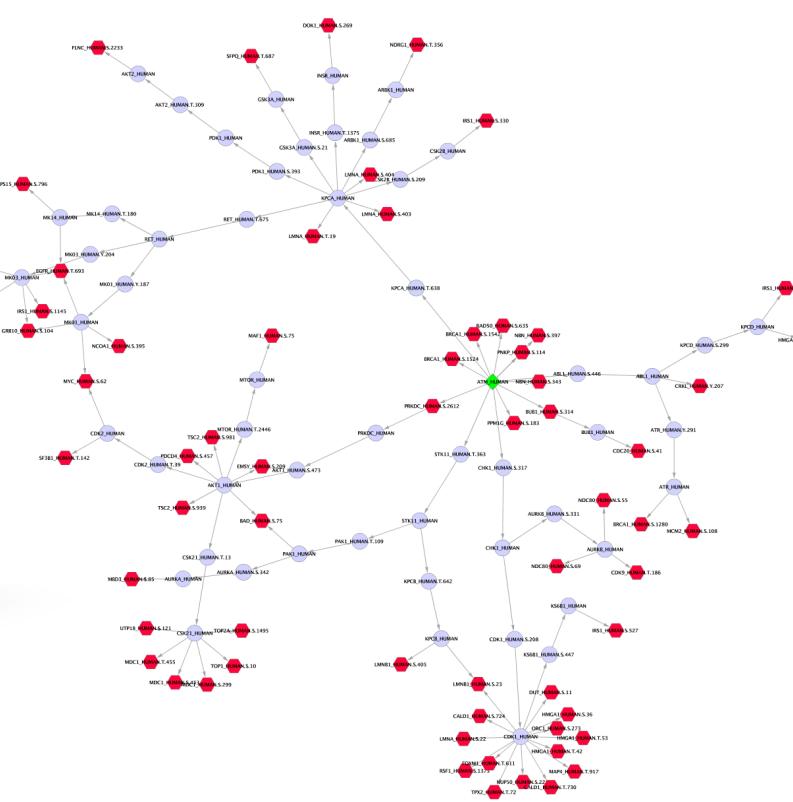

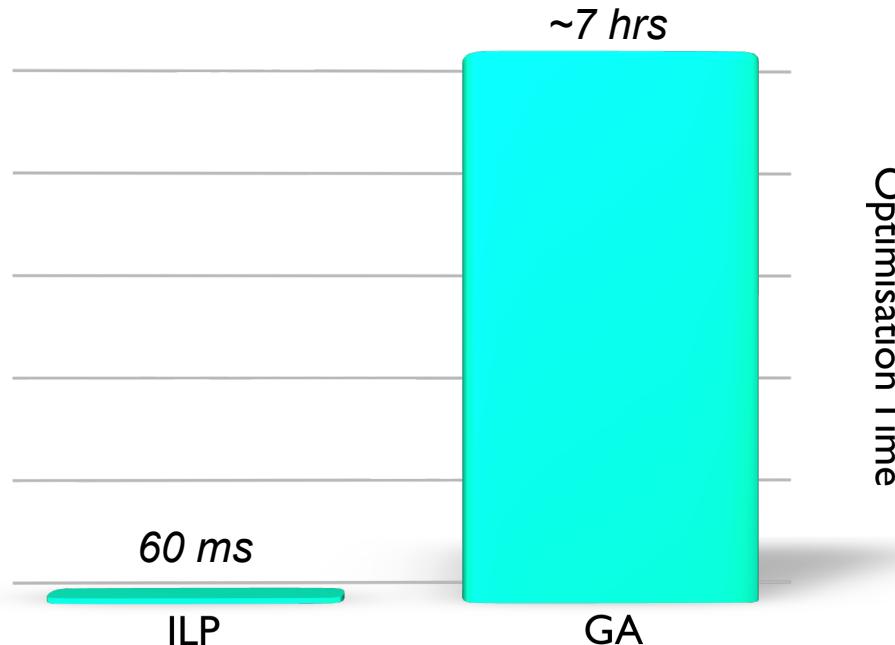

E. Gjerga

Finding logical perturbation flow

IBM
CPLEX

PHONEMeS ILP is orders of magnitude more efficient than the previous implementation - **Time Efficient !!!**

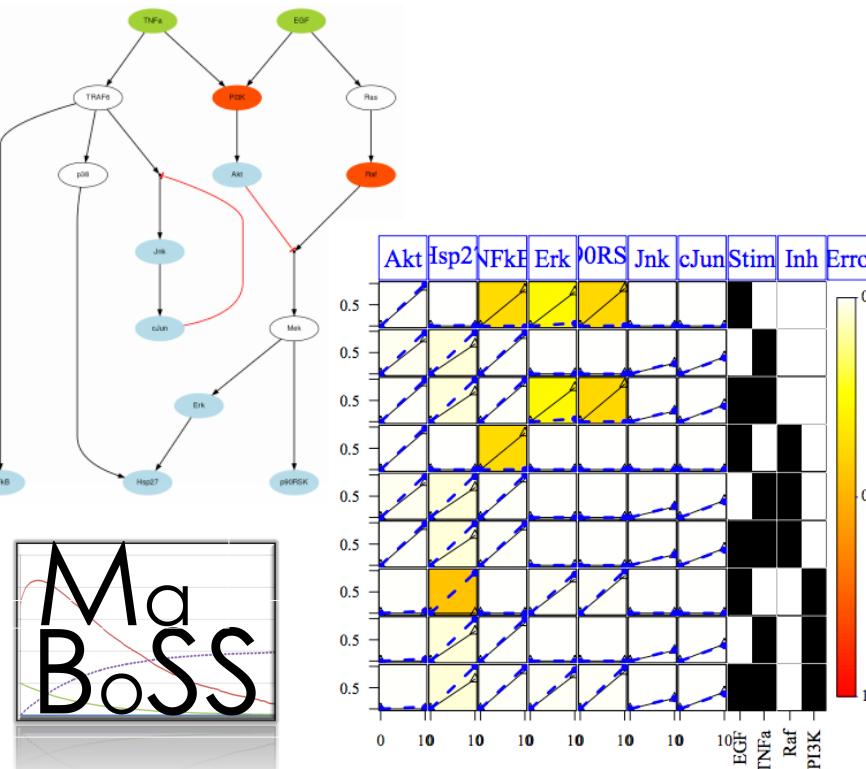

Ongoing work with ILP and Phonemes

Modelling through multiple targets

Modelling of perturbation propagation from a receptor level through hybrid interactions

Time course PHONEMeS

MaBoSS implementation in CellNOpt

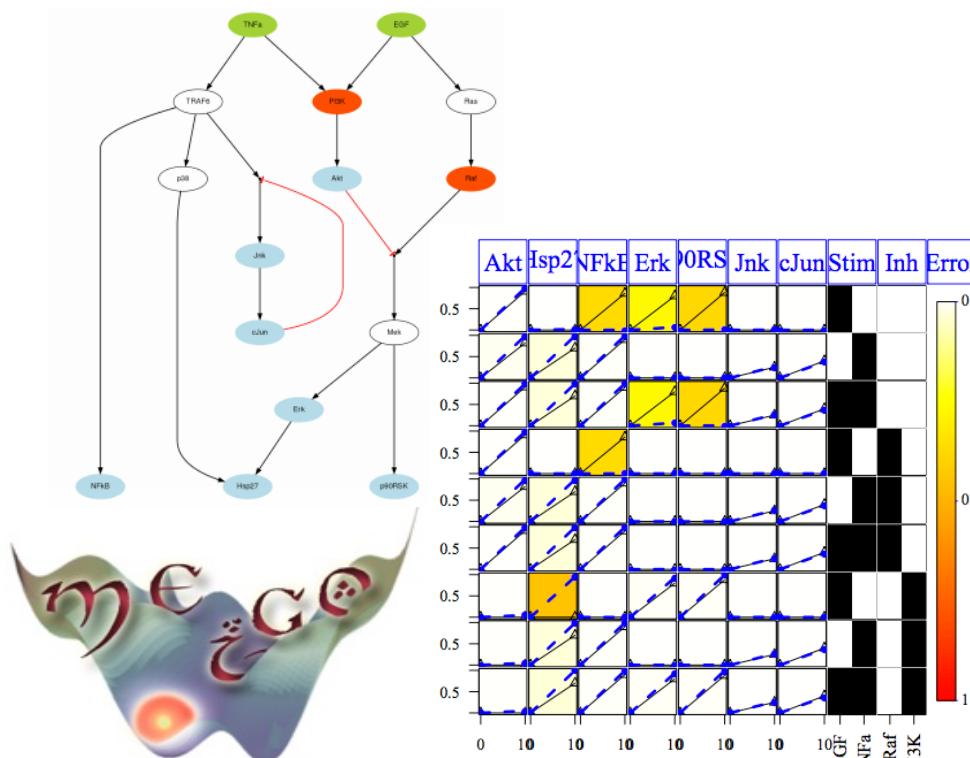

MaBoSS, an algorithm for modelling biological networks in discrete framework with continuous time

Simulates the probabilities for each species to be active at each condition

MaBoSS simulator for CellNOpt

Stoll et.al., *BMC Sys Biol*, 2012
C. Chevalier

New C NORode version released in *Github*

C NORode allows a quantitative description of a boolean model through the identification of logic ODE parameters

New features:

L1 regularisation penalty term is added to the objective function

An additional **steady state penalty** prioritises this parameter sets in which the steady state is reached

Bootstrap or optimisation with random resampling allows to determine the confidence intervals for each parameter

Download package in: <https://github.com/saezlab/CNORode2017>
